### **DETAILED ACTION**

Page 2

## Claim Objections

Claims 53, 54, 96, and 97 set forth limitations upon the manner in which the treated regions are deposited (e.g. "wherein the amount of the film forming composition...varies between at lest two of the layers..."). As indicated in the previous Office Action dated March 8, 2007, the instant claims may well provide limitations upon the steps required to fabricate the claimed paper wrapper, however it is entirely unclear that the claimed method steps add any patentably distinct structural limitations to the paper itself. Since the claims are drawn to the paper article and not to the method of fabricating said article, the instant claims are objected to for failing to further limit the subject matter of the parent claim.

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.

Art Unit: 1731

4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 41-65, 68-108, and 110-113 are rejected under 35 U.S.C. 103(a) as being unpatentable over Peterson (US 5,878,753) in view of Hampl (US 4,739,755) and Hampl (US 6,298,860 B1).

With respect to independent **claims 41, 70, 83, and 113**, Peterson teaches a paper wrapper for a cigarette and the cigarette comprising said wrapper and tobacco column as depicted in the instant reference Figures 1 and 2. Figure 2 teaches cigarette paper web presenting a plurality of "discrete circumferential bands" [Claims 42, 84] coated with a film forming composition wherein consecutive bands are spaced apart by untreated regions of paper web. The reference clearly teaches that the treated regions have "a preferred permeability less than 6 ml/min.cm² (Coresta), and generally within a range of 2-6 ml/min/cm²." (Column 5, lines 57-62) [Claim 68, 95, 111]

It is the Examiners understanding that both the Coresta (CU) and BMI or "Burn mode index" represent alternate but effectively equivalent measures of porosity and in the instant case specifically describe the porosity of the treated region or bands. To this end, although Peterson discloses a Coresta value for the bands which reads upon the claimed range, the reference fails to disclose the treated band porosity as measured by the BMI value.

The patent to Hampl et. al. (US 4,739,775) provides insight into the BMI value and its relation to the CU. The Hampl reference relates the methods of acquiring a BMI value in addition to presenting an exemplary comparison between the Coresta value of a wrapper (30 CU) and its equivalent porosity as measured by BMI (14 cm-1) (see

Art Unit: 1731

Table 1). By the Hampl reference, it is the Examiners understanding that the CU and BMI are related by an <u>approximate</u> 2:1 ratio (e.g. 30 CU:14 BMI). Therefore absent compelling evidence to the contrary, Peterson is understood to teach a treated band presenting a BMI value of approximately 3 cm<sup>-1</sup> or less (e.g. half the CU value of less than 6 CU) [Claim 69, 81, 82, 112].

With respect the particular details of band width and spacing as required by

Claims 70 and 113, the Peterson reference teaches that "Applicants have determined that, for the cigarettes tested, a minimum band width of 4mm is desired" (Column 6, Lines 3-4) [claim 43, 85] and that "In the cigarettes tested, applicants have found that a band spacing of between 5 and 10mm is appropriate" (Column 6, Lines 18-19) [Claim 44, 45, 86, 87].

Peterson further sets forth both band spacing and band width as clear result effective variables subject to empirical optimization. Specifically, Peterson teaches that the "width and spacing of bands are dependent on a number of variables, such as the initial permeability of wrapper 14, density of tobacco column 12, etc". The reference continues by teaching that the bands preferably have a width sufficient to limit the oxygen provided to the burning coal. The reference further asserts that the band spacing should not be so large as to promote burning trough the bands, but not so small as to self-extinguish the cigarette in a free-burn state. Therefore, the band width and band spacing are held as result effective variables of the paper wrapper which one of ordinary skill in the art would be able to optimize through routine experimentation.

Art Unit: 1731

The instant reference further discloses that "Applicants have found that a non-aqueous solution of a solvent soluble cellulosic polymer with a particulate inorganic non-reactive filler suspended in solution works particularly well" (Column 6, Lines 25-28)

[Claim 52, 57, 58, 63, 64, 73, 94, 100, 101, 106, 107]. The reference continues by teaching that particularly well-suited fillers include titanium oxide or a "metal oxide"

[Claim 65, 72, 74, 108] (Column 7, Line 5) and that ethyl cellulose acts as a preferred binder for the filler particles (Column 6, Lines 54-56) [Claim 75]. While the above coating composition sets forth a preferred embodiment, Peterson teaches that aqueous solutions [Claim 56, 99] which a variety of common film forming components include alginate, polyvinyl alcohol [Claim 48, Claim 50, 90, 92]. Although not expressly disclosed in the instant reference, one of ordinary skill in the art would recognize both polyvinyl acetate and starch as potential substitutes for the film forming component in the film forming composition [Claim 49, claim 51, 71, 91, 93].

IN discussing the mode of depositing the bands, Peterson discloses that the bands are deposited using a commercial gravure press in a 3 pass process [ Claim 46, 47, 79, 80, 88, 89]. Said deposition produces a "ramp pattern" increasing gradually from 0% to 100% over the three printing passes Column 11, Lines 26-57). The disclosed process is understood to vary the amount of film forming composition applied to the paper web by at least 1% between at least two of the layers [Claim 53, 54, 96, 97].

Now, Peterson fails to explicitly teach the application of an alkali metal citrate to the paper web to act as a "burn control additive", however such an addition would have

Art Unit: 1731

been readily obvious to one of ordinary skill in the art at the time of the invention. Again looking to the analogous teachings of Hampl (US 4,739,775), it is disclosed that "While the base cigarette paper may be conventional, it may contain small amounts of an ash conditioner, such as potassium citrate. However the amount of the ash conditioner must be below the level which causes the wrappers to support combustion of a cigarette in spite of the bands. (Column 4, Lines 52-58). It would have therefore been obvious to one of ordinary skill in the art at the time of the invention to modify the Peterson invention to include a burn control additive such as an alkali citrate [Claims 60, 61, 62, 103, 104, 105]. This would have been an obvious modification to one of ordinary skill seeking to promote ash formation in a cigarette article.

Additionally, while Peterson teaches the use of a particular commercially available brand of paper (e.g. Kimberly-Clark Corporation KC Grade 603 paper) with a porosity of approximately 35 CU, the reference fails to explicitly teach the use of a paper web having a permeability of greater than about 60 CU as required by independent Claims 41, 70, 83, and 113. That said, Peterson does teach that "Wrapper (14) may include any manner of commercially available cigarette wrapper,....It should be understood that any other manner of paper web may be used in this regard."(Column 5, Lines 23-27). Hampl (US 6,298,860 B1) teaches the use of a paper for contructing smoking articles having a basis weight from 18 gsm to 60 gsm [Claims 59, 102] and also having "a permeability of from about 5 Coresta units to about 80 Coresta units" (Column 2, Lines 46-51). Since the use of a cigarette paper having a porosity of about 80 Coresta units is known in the art of cigarette manufacturing and Peterson teaches

Art Unit: 1731

that any manner of commercially available cigarette paper can be used in the disclosed invention, the use of a paper having a permeability of "greater than about 60 Coresta" or "greater than about 80 Coresta units" would have been obvious modification to the Peterson process at the time of the invention [Claims 55, 76, 77, 78, 98].

## Response to Arguments

Applicant's arguments filed July 11, 2007 have been fully considered but they are not persuasive.

Applicant asserts (Applicants reply Page 10, lines 1-2) that "none of the references disclose a paper wrapper having a permeability of greater than about 60 Coresta". The Examiner strongly disagrees. Applicant is directed to the second paragraph of Page 7 in the prior Office Action dated March 8, 2007 which explicitly states that,

"Hampl (US 6,298,860 B1) teaches the use of a paper for contructing smoking articles having a basis weight from 18 gsm to 60 gsm [Claims 59, 102] and also having "a permeability of from about 5 Coresta units to about 80 Coresta units" (Column 2, Lines 46-51). Since the use of a cigarette paper having a porosity of about 80 Coresta units is known in the art of cigarette manufacturing and Peterson teaches that any manner of commercially available cigarette paper can be used in the disclosed

Art Unit: 1731

invention, the use of a paper having a permeability of "greater than about 60 Coresta" or "greater than about 80 Coresta units" would have been obvious modification to the Peterson process at the time of the invention" In view of the foregoing, Applicants allegation that the Examiner has admitted that "none of the references disclose a paper wrapper having a permeability of greater than about 60 Coresta" is clearly without merit.

Therefore to restate the grounds of the rejection, Peterson teaches that any commercially available cigarette paper may be used in the fabrication of the disclosed invention and Hampl '860 discloses cigarette papers having porosity up to about 80 Coresta units. Applicant further acknowledges that the wrapper porosity contributes, in a known and established manner, to various properties of the fabricated cigarette (page 10, lines 7-17). In view of the Peterson teaching it would have been obvoius to use any available cigarette paper porosity including up to about 80 CU as taught by Hampl in order to fabricate a cigarette displaying the desired burn properties.

Applicant is advised that the recent KSR decision forecloses the argument that a specific teaching, suggestion or motivation is required to support a finding of obviousness, see the recent Board decision Ex parte Smith, --USPQ2d--, slip op. at 20, (Bd. Pat. App. & Interf. June 25, 2007). Although Applicant has acknowledged the factual deficiencies of the prior art, he has provided no convincing evidence to rebut the

basis for the obviousness rejection. The rejection is deemed proper and stands as originally presented.

#### Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jason L. Lazorcik whose telephone number is (571) 272-2217. The examiner can normally be reached on Monday through Friday 8:30 am to 5:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Steven Griffin can be reached on (571) 272-1189. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
